<i>Project card</i>				
Subject: Detection of AI-Generated Images in Social Media				
The goal of this project is to create an app that checks if an image is real or generated by AI. Right now, social media is full of AI-generated pictures, and it's getting really hard to tell what's real and what's fake. Our system will analyze an uploaded image and say if it's REAL or AI GENERATED. It will also show a percentage score of how confident the model is about its decision.				
Main assumptions:				
Method of implementation: We are going to use deep learning, specifically Convolutional Neural Network. First, we will collect a dataset of real and AI-generated images. Then, we will prepare the data resizing, normalization, and basic augmentations like flipping. We will start by training a simple baseline CNN model, and then fine-tune it to get better results. At the end, we will test the model using standard metrics like Accuracy and F1-score. Instead of training from scratch, we will use transfer learning with pre-trained models like ResNet50.				
Sources: Data sources: Kaggle datasets for AI vs real images. Libraries: Python, Pytorch, torchvision, numpy, pandas, scikit-learn, matplotlib. Solutions used: Pre-trained ResNet weights. We will also use Streamlit to build a web interface, and Github to host our code.
